Case Palletizer

The Whallon Machinery automatic case palletizer is a versatile unit that can be designed to meet any customer's needs. The convenient user friendly floor level operation allows the infeed to be set as low as 28" and full pallet pick-up can be set as low as 11". The many designs available allow the equipment to fit most customer space requirements. Whallon case palletizers are available in a full range of speeds and capabilities for low, medium, or high volume applications. The simplified design and operation of the system enable the palletizer to handle various case sizes

in multiple pattern configurations with minimal maintenance, changeover, and downtime. Also the units can stack cases on pallets or slaveboards, with or without slipsheets. Customers can select standard case patterns, or the palletizers can be programmed to handle specialty patterns. The operator selects the desired case pattern, pallet height, and varying layer arrangements by programming the PLC using technically advanced interfaces. All of the pallet handling is automatic, and the units can be set up to easily interface with stretch wrappers or existing equipment.

Certain safety features removed for photographic purposes.

Case Palletizer

The Whallon Machinery case palletizer shares the tradition of all Whallon equipment. The system is constructed of heavy-duty components and reliable high quality electric and mechanical controls. This means years of easy maintenance and trouble-free service for a competitive price. Also, Whallon has an excellent service department that provides assistance with installation, startup, training, trouble shooting, and phone support for the life of the machine.
