HP300 Case Palletizer

Whallon Machinery, Inc. offers a new case palletizing option. The HP300 Case Palletizer combines a compact layout with no overhead layer sweep and no case height restriction.

Many case patterns can be programmed into the machine. Changeover is done quickly with no tools. The unit stacks onto pallet or slaveboards, with or without slipsheets. The HP300 zoned layer table allows for accurate case orienting and layer forming. The machine can be purchased with or without the soft case turning conveyor.

The HP300 was designed to emphasize troublefree operation and easy maintenance. The operator selects the desired case pattern, pallet height, and varying layer arrangements using technically advanced yet operator friendly interfaces. The proven Whallon chain lift controlled by frequency drive provides smooth, fast and reliable handling of pallets during the stacking operation and pallet change-out. All pallets index automatically and units are easily interfaced with stretchwrappers or existing equipment.

Certain safety features removed for photographic purposes.
